AquaNeural — Cost & Financial Model

Investment logic, assumptions and commercial trajectory

Public financial summary. Figures are reproduced from the current AquaNeural business-case assumptions and should be treated as a concept-stage model.

Investment case

Metric	Planning value
Funding ask	₦3,500,000
Initial hardware/deployment investment	₦1,600,000
Subscription price	₦13,000 / farm / month
Year 3 active farms	9
Year 5 active farms	50
Year 5 subscription revenue	₦78M/year

Commercial trajectory

- Year 1: 1 new farm / 1 active farm.
- Year 2: 4 new farms / 5 active farms.
- Year 3: 4 new farms / 9 active farms.
- Year 4: 16 new farms / 25 active farms.
- Year 5: 25 new farms / 50 active farms.

Financial logic

The model combines one-time hardware/deployment economics with recurring subscription revenue. The business case projects EBITDA turning positive in Year 2 and cumulative break-even in early Year 4 under the base planning case.

The funding request includes a 20% contingency reserve for exchange-rate volatility, import-duty fluctuation and sensor replacement.

Market sizing

Level	Farms	Annual subscription opportunity
TAM	~1,000,000	₦156B
SAM	~40,000	₦6.24B
SOM	9 by Year 3 / 50 by Year 5	₦78M/year at Year 5 target

Financial discipline

- Projections are planning assumptions, not realised results.
- Hardware sales revenue is excluded from subscription opportunity calculations.
- Phase IV scale-out is not included in the current funding ask and requires a separate investment decision.
