

AquaNeural — Business Case

Concept / Pre-Development • Nigeria • Public portfolio summary

Sanitized from the confidential AquaNeural Business Case. This public version intentionally omits internal-only detail and source citations.

Investment decision

AquaNeural is an intelligent aquaculture management concept designed for small-scale fish farmers in Nigeria. The business case seeks ₦3,500,000 to move from concept validation through a live farm pilot and generate the evidence needed for any later scale-out decision.

Core proposition

- 24/7 monitoring of dissolved oxygen, pH, temperature and ammonia.
- Edge processing and autonomous intervention designed for power and connectivity constraints.
- Farmer-facing mobile dashboard that presents actionable health information rather than raw sensor data.

Funding & use of funds

Component	Budget (₦)	Purpose
Phase 0	150,000	Concept validation, pilot partner, site/connectivity surveys, regulatory checks
Phase I	1,400,000	Sensors, edge gateway, actuators, solar/inverter backup and assembly
Phase II	600,000	Dashboard, edge logic, AI/CV model training and lab validation
Phase III	750,000	Live installation, onboarding, monitoring and tuning
Contingency	580,000	FX volatility, import duties and sensor replacement
TOTAL	3,500,000	Funding request for Phases 0–III

Market & commercial logic

Market level	Basis	Indicative annual subscription value
TAM	~1,000,000 small-scale Nigerian farms	₦156B
SAM	~40,000 infrastructure-ready farms in Lagos, Ogun and Oyo	₦6.24B
SOM	9 farms by Year 3; 50 by Year 5	₦78M/year at 50 farms

Subscription figures use the confirmed ₦13,000/farm/month pricing assumption and exclude hardware sales revenue.

Decision controls

- Phase-gated funding: sponsor review is required before the next phase budget is released.
- Formal change control for scope, cost, schedule or quality baseline changes.
- Six non-negotiable pilot gate criteria determine whether scale-out should proceed.

Portfolio note

All financial figures, market sizing and performance targets are projections or planning assumptions at concept stage. They are not evidence of a completed commercial deployment.
